Hiring Team
Pitch Software GmbH
Berlin, Germany

Dear Hiring Team,

As a Senior Frontend Engineer with 8 years of experience building high-performance Single Page Applications, I was immediately drawn to the Senior Frontend Engineer role at Pitch. I have long admired how Pitch has redefined the presentation software space by combining a beautiful, cross-platform user experience with robust collaborative features. The opportunity to join a product-oriented team that values both thoughtfulness and pragmatism in building simple, maintainable solutions aligns perfectly with my engineering philosophy.

In my current role at Genentech, I spearheaded the redesign of our main clinical trial data product, migrating a legacy Vue.js application to a highly optimized React architecture. By introducing Redux for state management and React Query for request caching, I refactored complex class components into functional ones, resulting in a significantly more maintainable codebase. Furthermore, I optimized application performance through lazy loading and code splitting, substantially reducing load times as measured by Lighthouse. My approach to frontend engineering is deeply collaborative; I work closely with designers and cross-functional teams to bring features from early prototypes to polished, well-tested final implementations, ensuring reliability through Playwright end-to-end tests in our CI/CD pipeline.

Beyond React and state management, I am highly comfortable debugging across the entire stack. At OurNigeria, I architected a complex Nx monorepo managing six applications, including a Next.js frontend, a NestJS API backend, and a PostgreSQL database. This full-stack context allows me to understand the broader implications of frontend architectural decisions. While my core expertise lies in TypeScript and modern JavaScript, I am deeply enthusiastic about learning new paradigms. I have a strong willingness to master ClojureScript and Re-frame, and my track record of rapidly adopting new technologies—such as building a multi-agent AI system from scratch using Mastra and vector databases—demonstrates my ability to quickly become productive in new environments.

I would welcome the opportunity to discuss how my background in building scalable SPAs and my eagerness to dive into ClojureScript can contribute to the continued success of the Pitch platform. Thank you for your time and consideration.

Sincerely,

Ogbonna Arinze
