Certivity GmbH
Recruiting Team
Munich, Germany

Dear Hiring Team,

Certivity caught my attention because you are solving a genuinely hard problem: making regulatory compliance fast and scalable through AI, not just digitizing paperwork. The fact that a team of five engineers powers a platform serving 1,500+ users across 10 countries tells me each person on the team has serious ownership and impact. That is exactly the kind of environment where I do my best work, and I would love to bring my 6+ years of full-stack experience to your Senior Full-Stack Software Engineer role.

In my current position as a Senior Full-Stack Software Engineer at Roche Genentech, I own features end-to-end on a clinical trial data platform, from design through deployment. I build data-intensive dashboards and analytics workflows using React 18, TypeScript, and Tanstack Query, paired with GraphQL and REST APIs that serve complex datasets to global users. I work daily with MongoDB-backed data views, Vite-based build pipelines, and Tailwind CSS, which maps directly to your stack. On the backend side, I have hands-on experience with Node.js and Python services, and I am comfortable making independent architectural decisions that affect the full product.

Before Roche, I served as a Staff Full-Stack Engineer at DESCASIO, where I owned the architecture of a data-heavy React dashboard backed by MongoDB and PostgreSQL. I built Node.js APIs, optimized frontend performance by reducing bundle sizes by 30%-40% (resulting in a 35% faster load time), and designed intuitive end-to-end user workflows for complex data operations. I also mentored junior engineers and established engineering standards across the team, experience that translates well to a small, high-autonomy team like yours.

What excites me most about Certivity is the intersection of AI and regulatory compliance in a product that manufacturers genuinely need. I have spent years building data-intensive interfaces for regulated industries, and I would welcome the chance to apply that experience to helping your platform scale further. I would be happy to discuss how I can contribute to the team.

Best regards,

Ogbonna Arinze
