Akeno
Recruiting Team
Hamburg, Germany

Dear Hiring Team,

Production planning for chemical manufacturing is one of those problems where software can unlock genuinely massive value, and Akeno is tackling it with an AI-first approach and a modern stack that I find very compelling. I spotted your listing on Hacker News and immediately recognized the kind of engineering challenge I thrive on: complex domain logic, data-heavy interfaces, and a small team where every engineer shapes the product. I would love to bring my 6+ years of fullstack experience to the Senior/Staff Fullstack Engineer role.

As a Senior Fullstack Engineer at Roche Genentech, I own features end-to-end on a clinical trial data platform, from database schema design through GraphQL APIs to React/TypeScript frontends. I architect data-intensive dashboards backed by PostgreSQL, build reusable component libraries with Radix UI and TailwindCSS, and maintain Docker-containerized services across staging and production, reducing environment-related configuration issues by 60%. I designed and implemented GraphQL APIs for complex data queries, optimizing PostgreSQL query performance through indexing and query plan analysis. I also integrated Playwright and Cypress end-to-end tests into the CI/CD pipeline with automated Allure reporting, giving the team real-time visibility into build quality. This daily experience across React, TypeScript, Node.js, PostgreSQL, GraphQL, TailwindCSS, and Docker maps directly to your core stack, and my familiarity with Hasura as a GraphQL middleware means I can be productive from day one.

Before Roche, I served as a Staff Fullstack Engineer at DESCASIO, where I owned the architecture of a data-heavy enterprise React dashboard with a Node.js backend and PostgreSQL database, using GraphQL subscriptions to handle large datasets across the stack. I reduced bundle sizes by 30-40% (achieving a 35% faster load time), implemented event-driven data processing workflows using Node.js and PostgreSQL triggers for real-time updates, and integrated AI-powered recommendation features using LLM APIs and retrieval-augmented generation. I also mentored junior engineers and established engineering standards across the team, which speaks to the collaborative, ownership-driven culture you describe at Akeno.

What excites me most is the chance to work on software that helps chemical manufacturers save millions, inside a team that values senior engineers who can see features through from UX to database and who create monitoring and testing so issues are caught before the customer ever notices. I would welcome the opportunity to discuss how I can contribute to Akeno's growth.

Best regards,

Ogbonna Arinze
