Hiring Team
Small Improvements
Berlin, Germany

Dear Hiring Team,

Your Senior Fullstack Developer posting caught my attention because it reads like a description of the work I love doing: shipping features across the full stack in a monolithic codebase, collaborating directly with product managers on what to build next, and caring deeply about clean architecture and code craftsmanship. The fact that Small Improvements is a feedback platform resonates with me personally. I have spent the last 6+ years building products where user experience and thoughtful interaction design directly determine whether people actually engage with the software, and I would love to bring that same mindset to a product that helps teams grow through better feedback.

At Roche Genentech, where I currently work as a Senior Fullstack Developer, I architect and ship fullstack features using React, TypeScript, and Node.js for a clinical trial data platform. I designed a reusable component system with Radix UI that improved accessibility and developer efficiency across multiple products, and I work closely with product managers to define requirements based on customer feedback and data analysis. I have also built secure authentication layers with JWT and role-based access control in Next.js, integrated Playwright and Jest into our CI/CD pipeline via GitHub Actions, and championed clean code practices through PR review standards and consistent tooling with ESLint and Prettier. All of this happens in a remote-first setup where proactive communication over Slack and GitHub is the norm, not the exception.

Before that, at DESCASIO LTD, I owned the architecture for a data-heavy React dashboard, where I applied domain-driven design principles to organize code around business domains, implemented feature flags for progressive rollouts, and reduced bundle size by 30-40% through targeted performance optimization, achieving 35% faster load times. I also established engineering standards across the team, mentored junior developers, and integrated PostgreSQL-backed APIs with the React frontend. I am particularly drawn to your emphasis on DDD and Clean Architecture within a monolithic application, as that mirrors how I have structured and scaled codebases throughout my career. I also use AI tools pragmatically to accelerate workflows while knowing exactly where to draw the line, which I noticed you value as well.

I would be excited to join a small, tight-knit team where I can have real ownership over features and contribute to a product that genuinely helps people improve. I would welcome the chance to

discuss how my experience building complex, customer-facing applications across the stack can help Small Improvements continue delivering value to its customers.

Best regards,

Ogbonna Arinze
