Hiring Team
Enpal
Berlin, Germany

Enpal stands out to me because it is building business-critical software in service of a mission that matters, accelerating adoption of residential clean energy through products that combine operational complexity, financing, and customer impact. The opportunity to join as a **(Senior) Fullstack Engineer - Enpal Financial Services - FinTech** is especially compelling because it sits directly in the fintech layer behind those products and rewards the kind of broad ownership I value most: designing and shipping systems across frontend, backend, integrations, deployment workflows, and operational concerns. With **8 years of professional experience** building user-facing products, backend services, and workflow-heavy business systems across healthcare, fintech, civic tech, and enterprise software, I would bring strong TypeScript, NodeJS, React, and product ownership to the team.

In my current work as **Senior Engineer** on OurNigeria, I architected and built the entire platform as an Nx monorepo managing 6 applications, including a NestJS API backend, Next.js citizen-facing web app, Next.js admin dashboard, ingestion pipeline, marketing site, and video generation service. I designed the PostgreSQL 16 schema with Prisma v7, built a hybrid RAG pipeline over 4 vector indexes, and configured CI/CD with GitHub Actions, Playwright end-to-end tests across 4 projects, and Docker Compose production deployment with multi-stage Dockerfiles, health checks, memory limits, and graceful shutdown handling. That end-to-end system ownership, spanning backend services, frontend products, data design, and deployments, maps closely to Enpal's expectation that engineers build, run, and own systems rather than only implementing tickets.

At Genentech (Roche), as **Frontend Engineer**, I spearheaded the redesign of the main product for connecting and transferring clinical trial site data to various upstream EHR systems, migrating from a Vue.js web application to a Chrome extension in React. I implemented authentication and authorization workflows using JWT-based flows, HTTP-only cookies, protected routes, and permission-based UI rendering in collaboration with backend engineers, while introducing Redux and React Query to improve maintainability and delivery speed. I also co-developed a full-stack Next.js chat widget powered by a Retrieval-Augmented Generation system using OpenAI GPT models, LangChain, Vercel AI SDK, and Chroma, enabling users to connect data sources and query them in real time. Earlier at ActivEdge, as **Senior React Developer**, I helped build a high-volume bank Settlement Solution that boosted transaction settlement rates by **80%** and developed a real-time account reconciliation solution that improved reconciliation of daily transactions by **60%**. That combination of frontend delivery, API-backed systems, and fintech-adjacent workflow experience is the main reason this Enpal role feels like such a strong fit.

I would welcome the opportunity to discuss how my background in TypeScript, NodeJS, React, Next.js, integrations, CI/CD, and end-to-end product ownership can help Enpal Financial Services continue building reliable systems that support Enpal's growth.

Sincerely,

Ogbonna Arinze
