Hiring Team
epilot GmbH
Im Mediapark 8a
50670 Cologne, Germany

epilot's mission to make complex energy products as easy to sell online as a pair of shoes is exactly the kind of product challenge I want to work on. I am applying for the **Senior/Staff Product Engineer (Frontend)** role because it brings together the parts of engineering I care most about: building React and TypeScript products that solve messy real-world workflows, partnering closely with design and product, and owning quality and delivery end to end. With **8 years of professional experience** across healthcare, fintech, civic tech, and enterprise SaaS, I would bring the combination of frontend depth, product thinking, and cross-functional execution that your team is looking for.

In my current role as **Frontend Engineer** at Genentech (Roche), I spearheaded the redesign of a core clinical-trial product, migrating it from a Vue.js web application to a React Chrome extension while continuing to support feature delivery in the legacy application during the transition. I also introduced Redux for state management and React Query for request caching, implemented JWT-based authentication and authorization workflows on the frontend, and increased stakeholder confidence by writing Playwright end-to-end tests in the CI/CD pipeline, publishing Allure reports on GitHub Pages, and sending Slack notifications with links to test results on every push. That mix of product delivery, API-heavy frontend work, and testing discipline maps directly to epilot's emphasis on ownership, React expertise, and shipping reliable software in cross-functional teams.

At Descasio, as **Senior Frontend Developer**, I led the design and implementation of an intuitive React user interface that drove a **25% boost in user engagement** and collaborated with architects to create a scalable frontend architecture that accelerated development by **30%**. I also introduced Jest and Enzyme, which led to a **20% decrease in bug reports**, and profiled render bottlenecks using React Profiler and Lighthouse to reduce bundle size by **30-40%**, resulting in a **35% faster load time**. Those outcomes reflect how I like to work, not just implementing screens, but improving performance, maintainability, and delivery speed in ways users and teams can feel.

I would be excited to bring that same approach to epilot, helping your team build product experiences that make complex energy workflows simpler, faster, and more intuitive for customers. I would welcome the opportunity to discuss how my background in React product engineering, frontend architecture, CI/CD quality practices, and close collaboration with product and design can contribute to your roadmap.

Sincerely,

Ogbonna Arinze
