Hiring Team
ClickHouse / HyperDX
Remote, Germany

Dear Hiring Team,

When ClickHouse acquired HyperDX, it signaled something I have been watching for: a serious, open-source challenge to the overpriced observability status quo. The idea of making production debugging accessible at 10x less than Datadog, built natively on the fastest columnar database in the market, is exactly the kind of developer tooling I want to help build. I am applying for the Frontend Engineer position on the HyperDX team because my 8 years of experience building data-intensive, real-time web applications maps directly to the challenges of rendering petabyte-scale observability data in a performant, intuitive UI.

At Genentech (Roche), I have spent the last three years as a Frontend Engineer working across React, TypeScript, and Next.js at production scale. I led a full application migration from Vue.js to React, architected a reusable design system with Radix UI and Tailwind CSS, and co-developed a full-stack Next.js RAG-powered chat widget using OpenAI, LangChain, and Chroma vector database. Performance is a constant focus: I implemented lazy loading, code splitting, and CDN asset delivery, profiling improvements with Lighthouse and Chrome DevTools. I also integrated Playwright end-to-end tests into our GitHub Actions CI/CD pipeline with automated Allure Reports, giving the team confidence in every release.

What makes me especially well-suited for HyperDX is my direct experience with the exact problems your platform solves. At ActivEdge Technologies, I built real-time data visualization dashboards using React and react-chartjs for a bank settlement solution processing millions of daily transactions, and adopted the native EventSource API for real-time streaming to replace socket.io for lower-latency updates. More recently, with OurNigeria (ournigeria.ng), I architected a full-stack platform as an Nx monorepo with NestJS, Next.js, PostgreSQL, and Docker Compose, where I designed the database schema with Prisma and pgvector, implemented SSE streaming for real-time responses, built 22 interactive chart types with Recharts, and integrated Langfuse for LLM observability. I understand both the frontend challenge of rendering high-volume data smoothly and the backend challenge of querying, streaming, and containerizing it reliably.

I am excited about the opportunity to shape HyperDX's product alongside the open-source community. I would welcome the chance to discuss how my experience with real-time data visualization, performance optimization, and fullstack TypeScript/Node.js development can help ClickHouse build the observability platform engineers actually want to use.

Sincerely,

Ogbonna Arinze
