Hiring Team
Langdock GmbH
Greifswalder Strasse 212, Berlin, Germany

Dear Hiring Team,

Langdock's trajectory from EUR 1M to EUR 15M+ ARR in a single year, serving 60,000+ monthly active users across 5,000+ companies, tells me the unified AI abstraction layer you have built genuinely solves the enterprise AI adoption problem. The engineering challenges behind that, prompt caching across providers, resumable streaming, agent orchestration with human-in-the-loop workflows, are exactly the problems I have been solving in production. I am applying for the Fullstack Engineer role, bringing 8 years of professional experience building AI-powered TypeScript applications across React, Node.js, and NestJS.

At Genentech, I co-developed a full-stack Next.js chat widget powered by a RAG system using OpenAI GPT models, LangChain, Vercel AI SDK, and Chroma vector database, enabling users to connect data sources and query them conversationally in real time. I also architected a reusable React design system with Radix UI and Tailwind CSS that improved UI consistency across product teams, and integrated Playwright end-to-end tests into the CI/CD pipeline with Allure Reports for build quality visibility. Earlier, at ActivEdge Technologies, I built a bank Settlement Solution handling millions of daily transactions, adopting the native EventSource API for real-time data streaming to replace socket.io, boosting settlement rates by 80%.

Most directly relevant to Langdock's work, I recently built OurNigeria (ournigeria.ng) end-to-end as a fullstack AI platform. I designed a multi-agent AI system using Mastra with 5 specialized agents and three-stage intent classification, powered by a hybrid RAG pipeline combining pgvector similarity search with BM25 full-text search over 708K+ vector embeddings, Cohere reranking, and Voyage AI embeddings. I implemented SSE streaming with keepalive heartbeats for real-time chat responses, built the NestJS backend and Next.js frontend as an Nx monorepo managing 6 applications, and deployed everything with Docker Compose, PostgreSQL 16, Prisma, and Langfuse for LLM observability. This experience, building agentic workflows, streaming infrastructure, and AI-native UI from database schema to production deployment, maps directly to what Langdock's engineering team ships every day.

I use AI tools daily and have strong opinions about what makes LLM orchestration reliable at scale. I would welcome the opportunity to discuss how my experience building production AI infrastructure can contribute to Langdock's next phase of growth. I look forward to hearing from you.

Sincerely,

Ogbonna Arinze
