Hiring Team
Raisin
Berlin, Germany

Dear Hiring Team,

Raisin's platform consolidates 650+ savings offers across European banks for over a million investors managing 80+ billion euros, and that scale demands frontend infrastructure that simply cannot break. The (Senior) Frontend Infrastructure & Tooling Engineer role within the Tech Platform tribe is exactly where my 8 years of experience in frontend architecture, build tooling, CI/CD pipeline design, and developer experience optimization converge. I want to help Raisin's stream-aligned teams ship faster and with more confidence.

I bring direct, hands-on monorepo and platform engineering experience. Most recently, I architected an Nx monorepo with pnpm workspaces managing 6 applications (Next.js frontends, NestJS backends, and a video generation service), configured the shared CI/CD pipeline with GitHub Actions, Playwright end-to-end tests across 4 test projects, and Docker Compose production deployment with multi-stage Dockerfiles and health checks. At Descasio as Senior Frontend Developer, I owned the build tooling layer, reducing bundle sizes by 30-40% through Webpack and Rollup analysis (webpack-bundle-analyzer, rollup-plugin-visualizer), achieving 35% faster load times. I also established the team's engineering standards with ESLint, Prettier, Husky, and Lint-staged, and introduced Jest and Enzyme testing frameworks that drove a 20% decrease in bug reports, nurturing the team toward test automation as a default practice.

At Genentech (Roche) as Frontend Engineer, I integrated Playwright end-to-end tests into the GitHub Actions CI/CD pipeline with automated Allure Reports on GitHub Pages and Slack notifications on every push, giving the team immediate visibility into build quality. I also architected a reusable React design system with Radix UI and Tailwind CSS that improved developer velocity across multiple product teams, and led a Vue.js-to-React migration while maintaining the legacy codebase in parallel. These experiences, combined with my passion for developer tooling and platform thinking, align directly with Raisin's need for someone to own and evolve a large-scale frontend monorepo, optimize shared CI pipelines, and act as the "Frontend First Aid" contact for infrastructure issues.

I would welcome the opportunity to discuss how my infrastructure and tooling experience can accelerate Raisin's frontend platform. Thank you for your consideration.

Sincerely,

Ogbonna Arinze
